

Detection of c.286C>T mutation in CCDC39  
gene causing primary ciliary dyskinesia in  
Old English Sheepdog breed

**Customer:** Jan Novák, Dlouhá 1, 30000 Plzeň, Czech Republic

**Sample:**

Sample: 21-12345

Date received: 01.02.2021

Sample type: blood

Information provided by the customer

**Name:** Lassie DEMO

**Breed:** Plemeno

Tattoo number: 1392013

Microchip: 123 456 789 012 345

Reg. number: REGQ12345

Date of birth: 1.1.2020

Sex: female

Date of sampling: 01.02.2021

The identity of the animal has been checked.

**Result: Mutation was not detected (N/N)**

**Legend:** N/N = wild-type genotype. N/P = carrier of the mutation. P/P = mutated genotype (individual will be most probably affected with the disease). (N = negative, P = positive)

**Explanation**

Presence or absence of c.286C>T mutation in exon 3 of CCDC39 gene causing primary ciliary dyskinesia (PCD) in Old English Sheepdog breed was tested. PCD is an inherited disorder characterized by insufficient function of cilia of epithelial mucous membrane. Typical symptoms of PCD are recurrent infection of the upper and lower respiratory tract and reduced fertility in males.

Mutation that causes PCD in Old English Sheepdog breed is inherited as an autosomal recessive trait. That means the disease affects dogs with P/P genotype only. The dogs with N/P genotype are considered carriers of the disease (heterozygotes). In offspring of two heterozygous animals following genotype distribution can be expected: 25 % N/N, 25 % P/P and 50 % N/P.

Method: SOP188-MPS-canine, MPS

Date of issue: 06.02.2021

Date of testing: 01.02.2021 - 06.02.2021
