

Customer: Jan Novák, Dlouhá 1, 30000 Plzeň, Czech Republic**Sample:**

Sample: 08-12346

Date received: 01.01.2008

Sample type: buccal swab

Information provided by the customer

Name: Madame Théophile DEMO**Breed:** Persian cat

Date of birth: 31.12.1909

Reg. number: (CZ)ABCD EF 123/45/XYZ

Microchip: 123 456 789 012 345

Sex: female

Date of sampling: 01.01.2008

The identity of the animal has been checked.

Result: Mutation was not detected (N/N)**Legend:** N/N = wild-type genotype. N/P = carrier of the mutation. P/P = mutated genotype (individual will be most probably affected with the disease). (N = negative, P = positive)**Explanation**

Presence or absence of 15 bp deletion in HEXB gene causing GM2 gangliosidoses in Burmese cats was tested. GM2 gangliosidoses are progressive, fatal neuropathic lysosomal storage disease resulting from a deficiency of β -N-acetylhexosaminidase activity and causes accumulation of GM2 gangliosides in brain tissue. GM2 in Burmese cats has an early onset with severe signs by 3 months. Late signs include complete loss of hind limb use, blindness or epileptic like seizures. The kittens of Burmese cats affected by GM2 hardly survive for 6 months.

Deletion that causes GM2 in Burmese cats is inherited as an autosomal recessive trait. That means the disease affects dogs with P/P genotype only. The dogs with N/P genotype are considered carriers of the disease (heterozygotes). In offspring of two heterozygous animals following genotype distribution can be expected: 25 % N/N, 25 % P/P and 50 % N/P.

Method: SOPA_{griseq}_feline, ngs

Sensitivity (probability of correct identification of the defective form of the gene in heterozygous or mutated homozygous) is higher than 99%. Specificity (probability of correct identification of the normal form of the gene in a normal homozygous or heterozygous) is higher than 99%.

Date of issue: 06.01.2008

Date of testing: 12.06.2008 - 06.01.2008
