Explanation

Presence or absence of c.1288G>A mutation in ATG4D gene causing Lysosomal Storage Disease (LSD) in Lagotto Romagnolo was tested. LSD is a neurodegenerative disorder. The occurrence of a neurodegenerative disease is associated with malfunction of degradation processes and subsequent accumulation of various types of cellular materials in lysosomes of cell. Symptoms are progressive cerebellar ataxia, slight atrophy of cerebellum and forebrain, abnormal involuntary eye movement and behavioural ganges.

Mutation that causes LSD in Lagotto Romagnolo is inherited as an autosomal recessive trait. That means the disease affects dogs with P/P genotype only. The dogs with N/P genotype are considered carriers of the disease (heterozygotes), they are healthy but they can transmit the mutation on their offspring. In offspring of two heterozygous animals following genotype distribution can be expected: 25 % N/N (healthy non-carriers), 50 % N/P (healthy carriers) and 25 % P/P (affected).
