Result certificate #012345

Detection of c.127_*2052del mutation
in GP9 gene causing BSS
in English Cocker Spaniels

Customer: Jan Novák, Dlouhá 1, 30000 Plzeň, Czech Republic
Sample:
Sample: 21-12345
Date received: 01.02.2021
Sample type: blood

Information provided by the customer
Name: Lassie DEMO
Breed: Plemeno
Tattoo number: 1392013
Microchip: 123 456 789 012 345
Reg. number: REGQ12345
Date of birth: 1.1.2020
Sex: female
Date of sampling: 01.02.2021
The identity of the animal has been checked.

Result: Mutation was not detected (N/N)

Legend: N/N = wild-type genotype. N/P = carrier of the mutation. P/P = mutated genotype (individual will be most probably affected with the disease). (N = negative, P = positive)

Explanation

Presence or absence of c.127_*2052del mutation in GP9 gene causing Bernard Soulier syndrome (BSS) in English Cocker Spaniels was tested. BSS is lethal bleeding disorder that is characterized by low platelet count, unusually large platelets compared to the standard size and substantially worse blood clotting. The clinical signs involve excessive bleeding from cuts and other injuries, gum bleeding, nosebleeds, etc. Life threatened for the individuals suffering from BBS can also be traumatic injuries, childbirth or surgical operation.

Mutation that causes BSS is inherited autosomally recessively which means that the disease develops only in those dogs who inherit mutated allele from both parents; disease affects dogs with P/P genotype only. The dogs with N/P genotype are considered carriers of the disease (heterozygotes). In offspring of two heterozygous animals following genotype distribution can be expected: 25 % N/N, 25 % P/P and 50 % N/P.

Method: SOP188-MPS-canine, MPS

Date of issue: 06.02.2021
Date of testing: 01.02.2021 - 06.02.2021
Approved by: Mgr. Martina Šafrová, Laboratory Manager
