

Detection of c.2806C>T mutation in
COL4A4 gene causing Hereditary
Nephropathy in English Springer Spaniel

Customer: Jan Novák, Dlouhá 1, 30000 Plzeň, Czech Republic

Sample:

Sample: 21-12345

Date received: 01.02.2021

Sample type: blood

Information provided by the customer

Name: Lassie DEMO

Breed: Plemeno

Tattoo number: 1392013

Microchip: 123 456 789 012 345

Reg. number: REGQ12345

Date of birth: 1.1.2020

Sex: female

Date of sampling: 01.02.2021

The identity of the animal has been checked.

Result: Mutation was not detected (N/N)

Legend: N/N = wild-type genotype. N/P = carrier of the mutation. P/P = mutated genotype (individual will be most probably affected with the disease). (N = negative, P = positive)

Explanation

Presence or absence of mutation c.2806C>T in COL4A4 gene causing Hereditary Nephropathy (HN) in English Springer Spaniel was tested. Hereditary nephropathy is a fatal progressive renal disease. The affected dogs typically develop severe renal disease by the time they are 6-24 months of age. Clinical symptoms appear in late stage of the disease. Proteinuria can be diagnosed through a laboratory a few months before other clinical signs of the disease can be detected. The histological examination of the kidneys shows various degrees of changes in glomeruli structure.

Mutation that causes NH in English Springer Spaniel is inherited autosomally recessively which means that the disease develops only in those dogs who inherit mutated allele from both parents; disease affects dogs with P/P genotype only. The dogs with N/P genotype are considered carriers of the disease (heterozygotes). In offspring of two heterozygous animals following genotype distribution can be expected: 25 % N/N, 25 % P/P and 50 % N/P.

Method: SOP172-FN_SP, direct DNA sequencing

Date of issue: 06.02.2021

Date of testing: 01.02.2021 - 06.02.2021
