

Customer: Jan Novák, Dlouhá 1, 30000 Plzeň, Czech Republic

Sample:

Sample: 21-12345

Date received: 01.02.2021

Sample type: blood

Information provided by the customer

Name: Lassie DEMO

Breed: Plemeno

Tattoo number: 1392013

Microchip: 123 456 789 012 345

Reg. number: REGQ12345

Date of birth: 1.1.2020

Sex: female

Date of sampling: 01.02.2021

The identity of the animal has been checked.

Result: Mutation was not detected (N/N)

Legend: N/N = wild-type genotype. N/P = carrier of the mutation. P/P = mutated genotype (individual will be most probably affected with the disease). (N = negative, P = positive)

Explanation

Presence or absence of mutation c.979G>A in CAT gene causing hypocatalasia in Beagles and American Foxhounds was tested.

Hypocatalasia, or acatalasemia, is an inherited metabolic disease. It relates to reduced activity of the catalase enzyme that is commonly found in the red blood cells, in mucous membranes, in liver, muscles and skin. Its task is to protect the tissues from reactive oxygen species. The catalase deficiency leads to formation of ulcers and necrosis of soft tissues (also known as the gangrene). In dogs, this disease causes deep ulcers inside the mouth and periodontitis, particularly young dogs suffer from this disease.

Mutation that causes hypocatalasia in in Beagles and American Foxhounds is inherited autosomally recessively which means that the disease develops only in those dogs who inherit mutated allele from both parents; disease affects dogs with P/P genotype only. The dogs with N/P genotype are considered carriers of the disease (heterozygotes). In offspring of two heterozygous animals following genotype distribution can be expected: 25 % N/N, 25 % P/P and 50 % N/P.

Method: SOPAgriseq_canine, ngs

Date of issue: 06.02.2021

Date of testing: 01.02.2021 - 06.02.2021
