

## Result certificate #012345

Detection of c.866C>T mutation in GUSB gene causing mucopolysaccharidosis VII in Brazilian Terriers

Customer: Jan Novák, Dlouhá 1, 30000 Plzeň, Czech Republic

Sample: Sample: 21-12345 Date received: 01.02.2021 Sample type: blood

## Information provided by the customer Name: Lassie DEMO Breed: Plemeno

Tattoo number: 1392013 Microchip: 123 456 789 012 345 Reg. number: REGQ12345 Date of birth: 1.1.2020 Sex: female Date of sampling: 01.02.2021 The identity of the animal has been checked.

## Result: Mutation was not detected (N/N)

**Legend:** N/N = wild-type genotype. N/P = carrier of the mutation. P/P = mutated genotype (individual will be most probably affected with the disease). (N = negative, P = positive)

## Explanation

Presence or absence of c.866C>T mutation in GUSB gene causing mucopolysaccharidosis VII in Brazilian Terriers was tested. Mucopolysaccharidosis VII is a lysosomal storage disease in which mucopolysaccharides accumulate in lysosomes. Clinical signs include facial dysmorphia (noticeable shortening and widening of the muzzle and low-set ears as early as 4 weeks of age in puppies), diffuse corneal opacity, presence of glycosaminoglycans in the urine, bone lesions, lack of body growth relative to the head, later joint problems, and even inability to stand. Various cardiac abnormalities may also occur.

Mutation that causes mucopolysaccharidosis VII is inherited autosomally recessively which means that the disease develops only in those dogs who inherit mutated allele from both parents; disease affects dogs with P/P genotype only. The dogs with N/P genotype are considered carriers of the disease (heterozygotes). In offspring of two heterozygous animals following genotype distribution can be expected: 25 % N/N, 25 % P/P and 50 % N/P.

Method: SOPAgriseq\_canine, ngs, accredited method

Date of issue: 06.02.2021 Date of testing: 01.02.2021 - 06.02.2021 Approved by: Mgr. Martina Šafrová, Laboratory Manager
