Result certificate #012345

Detection of c.2504A>G mutation in VPS11 gene causing NAD in Rottweilers

Customer: Jan Novák, Dlouhá 1, 30000 Plzeň, Czech Republic
Sample:
Sample: 21-12345
Date received: 01.02.2021
Sample type: blood

Information provided by the customer
Name: Lassie DEMO
Breed: Plemeno
Tattoo number: 1392013
Microchip: 123 456 789 012 345
Reg. number: REGQ12345
Date of birth: 1.1.2020
Sex: female
Date of sampling: 01.02.2021
The identity of the animal has been checked.

Result: Mutation was not detected (N/N)

Legend: N/N = wild-type genotype. N/P = carrier of the mutation. P/P = mutated genotype (individual will be most probably affected with the disease). (N = negative, P = positive)

Explanation

Presence or absence of c.2504A>G mutation in VPS11 gene causing Neuroaxonal dystrophy (NAD) in Rottweilers was tested. The first symptoms appear in puppies at approx. 3 months of age. There can be observed problems with gait (it may develop partial or complete limb paralysis), loss of coordination, head tremor or intention tremor, inability to stand (astasia) and further neurological symptoms occur from the 6th month of age, such as blindness, strabismus, loss of reaction to threat, difficulty swallowing and progressive celebellar atrophy.

Mutation that causes NAD is inherited autosomally recessively which means that the disease develops only in those dogs who inherit mutated allele from both parents; disease affects dogs with P/P genotype only. The dogs with N/P genotype are considered carriers of the disease (heterozygotes). In offspring of two heterozygous animals following genotype distribution can be expected: 25 % N/N, 25 % P/P and 50 % N/P.

Method: SOPAgriseq_canine, ngs, accredited method

Date of issue: 06.02.2021
Date of testing: 01.02.2021 - 06.02.2021
